

The loggerhead shrike may look innocent, but this songbird has earned the nickname “butcher bird” for its practice of impaling small prey upon thorns or barbed wire to facilitate tearing off chunks of flesh. Loggerhead shrikes have experienced dramatic population declines in the eastern United States for reasons that are not completely clear, but likely include loss of quality breeding habitat, the use of pesticides, and vehicle collisions.

Indiana & the Recovering America’s Wildlife Act

Indiana’s fertile till plains, forested rolling hills, and wetlands support a rich assortment of wildlife. Residents and visitors contribute nearly \$10 billion to the economy annually through outdoor recreation activities like fishing, birding, and hunting. However, with more than one-third of America’s wildlife at increased risk of extinction, Indiana could lose much of its beloved outdoor heritage. The Recovering America’s Wildlife Act will dedicate funding to help at-risk species before they become endangered—creating jobs and helping wildlife thrive in a rapidly changing world.

By the numbers:

144 species	The Indiana Department of Natural Resources (IDNR) has identified 144 species that need conservation assistance, including the barn owl, spotted turtle, clubshell mussel, and crawfish frog.
\$14.5 million	The Recovering America’s Wildlife Act would give IDNR \$14.5 million every year to help the 144 species in need through conservation action including habitat restoration, education, species reintroductions, research, and more.
\$900 thousand	The current source of federal funding in Indiana for proactive, locally-led wildlife conservation—state and tribal wildlife grants—is inadequate to help the species at risk.

Recovering America's Wildlife Act

America is in the midst of an unprecedented wildlife crisis. Once abundant populations of fish and wildlife are now facing steep declines because of habitat loss, disease, and other threats. The bipartisan Recovering America's Wildlife Act would dedicate \$1.4 billion annually to state and tribal-led wildlife conservation — helping prevent wildlife from becoming endangered in the first place. Indiana Conservation in Action

During the summer, an Indiana bat will eat as many as 3,000 insects every evening, including many crop pests. Unfortunately, disturbance of the caves Indiana bats depend on led to significant population declines and ultimately required a listing under the Endangered Species Act. The newest threat is white-nose syndrome, a fungus that has caused unprecedented mortality in many bat species, and has now been discovered in 38 caves in Indiana. Now more than ever, Indiana bats need Recovering America's Wildlife Act to fund conservation efforts like helping to recover remnant populations and researching innovative strategies to stop the disease.

Blanding's Turtle

Photo: Jillian Josimovich/Purdue University-Ft. Wayne

Easily distinguished by its bright yellow chin and throat, the Blanding's turtle is a gentle native of the Great Lakes region. Sadly, this charming turtle has declined substantially in the Midwest due to the loss and fragmentation of wetland habitat. Vehicles also pose a deadly threat to adults moving between wetlands and females searching for nesting sites. The Blanding's turtle is listed as endangered in Indiana, but Recovering America's Wildlife Act could help save the species. Funding from the Act would support critical conservation action, including preserving and restoring wetland habitat, captive breeding, and monitoring to determine the full extent of their distribution in Indiana.

Other Indiana Species of Greatest Conservation Need

Lake Sturgeon

Northern Bobwhite

Eastern Hellbender

Whooping Crane
